"Characterization of the cytoplasmic filament protein gene (cfpA) of
Treponema pallidum subsp. pallidum";
J. Bacteriol. 178:3177-3187(1996).
-!- FUNCTION: COMPONENT OF THE CYTOPLASMIC FILAMENTS THAT RUN THE
LENGTH OF THE ORGANISM JUST UNDERNEATH THE CYTOPLASMIC MEMBRANE.
-!- SUBCELLULAR LOCATION: AN ARRAY OF 4 TO 6 FILAMENTS LIE IN CLOSE
APPOSITION TO THE INNER MEMBRANE AND ARE ALWAYS LOCALIZED DIRECTLY

    ACIDIFYING A VARIETY OF INTRACELLULAR COMPARTMENTS IN EUKARYOTIC
                              SUBUNIT: V-ATPASE IS AN HETEROMULTIMERIC ENZYME COMPOSED OF A PERIPHERAL CATALYTIC VI COMPLEX (MAIN COMPONENTS: SUBUNITS A, B, C, D, E, AND F) ATTACHED TO AN INTEGRAL MEMBRANE VO PROTON PORE COMPLEX (MAIN COMPONENT: THE PROTECLIPID PROTEIN).
MISCELLANEOUS: TWO SEPRARTE GENES ENCODE THE CATALYTIC 70 KDA V-ATPASE SUBUNIT IN PSILOTUM AND EQUISETUM.
SIMILARITY: BELONGS TO THE ATPASE ALPHA/BETA CHAINS FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

"Isolation of a peptide structurally related to mammalian corticostatins from the lamprev Petronyzon marinus.";

Comp. Biochem. Physiol. 1148.133-137(1996).

-I- FUNCTION: MAY HAVE MICROBICIDAL ACTIVITIES. MAY INHIBIT CONTICOPROPIN (ACTH) STIMULATED STEROIDOGENESIS AND THE MICROBIAL ACTIONS OF THE CORTICOSTATINS.

-I- MASS SPECTROMETRY: MW-2201; MW_ERR-0.4; METHOD-ELECTROSPRAY.

-I- SIMILARITY: BELONGS TO THE FAMILY OF CORTICOSTATIN/DEFENSIN PEPTIDES.

```
The peptide from which this N-terminal sequence is taken can be used for treating inflammation and immune-mediated tissue damage such as occurs in the course of autoimmune diseases. e.g. Theumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hirudin expression vectors; signal sequence cleavage site; pTG2906; thrombin inhibitor; anticoagulant; alpha-antitrypsin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The peptide from which this N-terminal sequence is taken can be used
                                                                                   cell
                              The peptide can be used for treating inflammation and immunemediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis. This peptide corresponds to AA 12-42 of the CD44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of CD44 protein and new peptide derivs - for developing prods for inflammation, immune-mediated tissue damage and tumour cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          for treating inflammation and immune-mediated tissue damage such occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis.

                                                                                                                                                                                                                                                                                                                                                                                        The DNA sequence encoding hirudine is located downstream from the alpha-antitrypsin sequence ensuring the expression and release of hirudin in active form by cells into the culture medium. Between the two sequences is a BamHI site . See also AAN82293-95.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Testis; brain; identification; genetic disorder; antibody; ds;

Between the two sequences is a StuI site . Hirudin is a specific thrombin inhibitor useful as an anticoagulant.

                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                               Clone CC397-19 has been isolated from an adult human brain cDNA library, along with clones BV2325_17, CC25_17 and BV239_3. These clones and clone BL89_13 isolated from an adult human testis library, can be expressed in eukaryotic or prokaryotic host cells. The genes and protein sequences may be used for identification purposes for example for chromosome identification or to detect genetic disorders. They can also be used to
                                                                                                                                                                                                       identification or to detect genetic disorders. They can also be used to screen compounds for biological activity; to raise antibodies; as tissue markers; for isolation of related receptors and ligands and as nutritional sources. They may also have many biological activities such as cytokine and cell proliferation/differentiation activity;
                                                                                                                                                                                                                                                                            immunosuppressant/immunostimulant activity and regulation of haematopoiesis. Neutralising antibodies against the protein can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein; human adult brain; cDNA library; cell proliferation;
                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                       Nucleic acid encoding secreted protein from human testis or brain cells - and related vectors, transformed cells and proteins, potentially useful e.g. as immuno-modulators, antitumour agents, promoters of tissue growth, haemostatic and thrombolytic agents etc.
                                                                                                                                                                                                                                                                                                                                                                                                       0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human testes derived cDNA and protein(s) - may be useful for laboratory use, or for stimulating cell proliferation and

The preducts of the invention are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, haemostating estimulating (e.g. as vaccines) or suppressing activity, activity, cytokine activity, tissue growth activity, activity, cumbolytic activity, chemotactic/chemokinetic activity, activity, cathivity, chemotactic/chemokinetic activity, and and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, and tumour inhibition activity. The polynucleotides are also stated to be useful
This sequence is the CC397_11 protein, which is 27 amino acids in length, and is isolated from adult human brain cDNA library. When the CC397_11 sequence was searched in the Genbank database, the clone demonstrated no homology with any of the known sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Secreted protein; testes; brain; blood; placenta; human; murine; thymus; bone marrow; treatment; prevention; nutrition; cytokine; immune; vaccine; cell prolliferation; cell differentiation; suppressor; tumour inhibition; haematopolesis regulator; activin; inhibin; chemotactic; chemokinetic; haemostatic; thrombolytic; receptor; ligand; anti-inflammatory; tumour; cadherin; tumour invasion suppressor; gene therapy; tissue growth.
                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel human secreted proteins encoded by

AAB34823 to AAB34852 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticorvulsant; antibacterial; antifungal; antiparasitic; and cardiant. The polynucleotides and polypeptides are useful for mice, rabbits, goats, horses, cats, dogs, chickens or sheep. The polypeptides can also be used as a food additive or preservative to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           particularly breast and/or ovary cancer. They are also useful in the gene therapy of breast and ovarian cancer. Nucleic acids, protein, antibodies,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   increase or decrease storage capabilities. The polynucleotides are useful for chromosome identification. They are also useful as probes for diagnosing a disorder related to the female reproductive system,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fifty nucleic acid molecules encoding human secreted proteins, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; secreted protein; diagnosis; cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disorder; wound healing; neurological disease; infectious disease; chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The polynucleotide sequences given in AAC59966 to AAC60015 encode the

This is the human secreted protein CC397_19 amino acid sequence, the polynucleotide sequence encoding CC397_19 was obtained from a human ad adult brain cDNA library. The invention relates to secreted human and murine proteins. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Contection of the levels of the proteins can be used for the diagnosis of e.g. pre-eclampsia, placental pathology or cancer. Agents which modulate the expression or function of the proteins may be used for treating a compassit disease and inhibiting metastasis. Other suggested activities include nutritional activity (e.g. in feeds), cytokine and cell conditional activity, dead in feeds), cytokine and cell conditional activity, activity, immune stimulating (e.g. as vaccines) or suppressing activity, heamatopoissis regulating activity, tenemotactic/chemokinetic activity, heamatopoissis regulating activity, chemotactic/chemokinetic activity, haemacotatic and thrombolytic activity, cremotactic/chemokinetic activity, activi
                                                                                                                                                                                                                                                                                         ö
agonists and antagonists from the present invention are useful in the diagnosis, treatment and prevention of cancer, immune disorders, carditovascular disorders, wound healing, neurological diseases and infectious disease. AAC59955 and AAB34772 represents sequence used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               develop

The patent relates to a nucleic acid composition for introducing nucleic acid into a eukaryotic host cell to obtain expression of a recombinant protein which lacks all or a portion of the B domain of human Factor VII:: (hWVII::) and is capable of coagulation activity. The recombinant protein consists of a polypeptide substantially homologous to mature A domain of hWVII: as encoded by the polynucleotide present in plasmid pSVF8-200 (ATCC) number 40190); and a second polypeptide homologous to mature C domain of hWVII: as encoded by the polynucleotide present in plasmid pSVF8-200.

The composition is useful as an immunogen for the production of antibodies, for isolating vor-Wille-brand factor by affinity chromatography, in diagnostic assays for Factor VII:C and for treating Type A haemophilia and other bload clitting disorders.

The present sequence is human alphal-antitrypsin signal peptide used for secretion of recombinant protein of the invention.
                                                                                                                                       ö
invasion suppressor activity, and tumour inhibition activity. The polynucleotide sequences are also stated to be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                           Human; Factor VIII:C; FVIII:C; coagulation; von-Wille-brand factor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The DNA sequence encoding native hirudine is located downstream from the alpha-antitrypsin sequence ensuring the expression and release of hirudin in active form by cells into the culture medium. Between the two sequences is a StuI site. Hirudin is a specific thrombin inhibitor useful as an anticoagulant. See also AAN82293-95.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               17.7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method for treating systemic lupus erythematosus (SLE), which comprises administering an effective dose of at least one laminin peptide analogue or derivative. In one exemplairy embodiment, the laminin peptide is selected from the group consisting of R38 and claimed R38 analogues and derivatives including 5200, 5104, 5105, 5106, 5107, 5108, 5109 and 5110.

SLE is serologically characterised by the presence of autoantibodies in the serum, particularly anti-DNA autoantibodies, and the methods and products may be used to treat SLE using laminin derived peptides which cross react with those antibodies. At least one laminin, peptide may be used to prepare a therapeutic for administration to a mammal suffering in the immunosuppresive treatment is not associated with the side effects of prior art immunosuppresive treatment, and the monitoring assay is more specific and less invasive than prior art assays. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel mammalian dishevelled-associated proteins, nMkd and DAPlA, useful for inhibiting Wnt signalling in mammalian cells, and thus for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human secreted protein; cancer; tumour; neurodegenerative disorder; developmental abnormality; fetal deficiency; blood disorder; leukemia; immune system disease; autoimmune disease; hepatic disease; renal disease; lymphoma; inflammation; allergy; ischemic shock; Alzheimer's; cognitive disorder; schizophrenia; prostate disease; obesity; osteoclast; osteoporosis; arthritis; malignancy; testes disease, lung disease; thymus disease; digestive disorder; endocrine disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
Dishevelled-associated protein 1A; DAP1A; mNkd; dishevelled protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents an antigenic peptide of mNKD. The peptide was used to raise antibodies. The specification describes mNkd and dishevelled associated protein IA (DAPIA) proteins, that interact with mammalian dishevelled protein. mNkd is useful for inhibiting Wnt signalling in mammalian cells, and thus for treating colon cancer. mNkd is also useful for activating the JNK pathway. mNkd and DAPIA are also useful for screening drugs that are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 26;

The specification describes human secreted proteins. The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Pathological conditions can also be diagnosed by determining the presence of mutations in the polypucleotides. Specific uses are described for each of the polynucleotides. Specific uses are described for each of the polynucleotides. Specific uses are described for each of the polynucleotides. Specific uses are described for each of the polynucleotides. Specific uses are described for each of the polynucleotides. Specific uses are described for each of the polynucleotides. Specific uses are described for each of the polynucleotides. Specific uses are described for each of the indian developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental diseases and fetal deficiencies, blood disorders, leukemias, dischamic sand renal disease, lymphomas, inflammation, allergies, ischemic shock, Alzheimer's and cognitive disorders, schizophrenia, prostate diseases, obesity, and inconvented alsoness and products for the indian set of the indi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          malignancies, diseases of testes, lung or thymus, digestive/endocrine disorders, infections and AIDS. The polypeptides are also useful for identifying their binding partners.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated human genes and the secreted polypeptides they encode

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 10,
